

TEAM AEROSPACE SOLUTIONS

Transform Your Coking Removal Process

Proprietary Coking Removal for Critical Aerospace Components

TEAM Aerospace Solutions has developed a **proprietary coking removal** process designed specifically for components susceptible to internal buildup, including:

- Tubes
- Spray bars
- Internal cavities
- Fuel and fluid system components

Carbon and coke buildup inside these critical parts can impact performance, increase inspection failures, and drive unnecessary replacement costs. TEAM's proven process restores components to optimal condition with precision and consistency.

Proven Results. Reliable Performance.

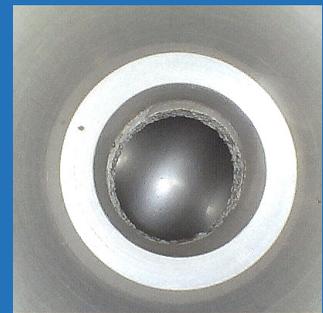

The **The Team Way** has streamlined the process to deliver consistent and repeatable coking removal results.

First Article Process Reliability Validation (Borescope Inspection, Cleanliness Verification) during initial part setups and when requested by the customer

Before Clean

Visible carbon buildup restricting internal flow

After Clean

Fully restored internal pathways and improved condition

The result is a repeatable, controlled process that delivers **consistent outcomes**.

Why TEAM?

Reduced Replacement Costs

Extend component life and avoid unnecessary part replacement.

Increased Inspection Pass Rates

Restore internal cavities to meet required specifications.

Streamlined Turnaround

Optimize for efficiency and repeatability with The Team Way.

Proven Expertise

Exceed precision, documentation, and performance standards.

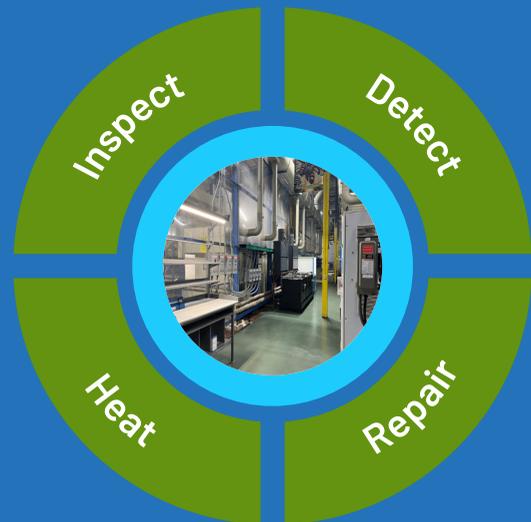

Validated Results

Process validation methods, including borescope inspection when requested, provide confidence before reinstallation.

Let TEAM Transform Your Process Today

Coking buildup is a performance risk. As a part of our TEAM360 framework, every service is designed to protect asset integrity, extend component life, and reduce avoidable cost across the full lifecycle. When integrated into your broader reliability plan, it becomes a lever for measurable performance improvement – helps reduce costly cut-and-hone repair procedures by restoring internal passages through precision cleaning and inspection.
